

# Comparing the Addition of GemIni DVM to Standard Practice in a Clinical Setting

GemIni Trial (2012) Dr. Larissa Morlock

Performed by Eden Services (Princeton NJ)

Dr. Larissa Morlock, formerly Eden's Assistant Director of Research, used GemIni videos with students with autism and other co-morbid disorders at Eden's main clinic in Princeton NJ. GemIni was used in addition to standard interventions. Language acquisition by the children exposed to GemIni improved dramatically.

Excerpt from letter by Dr. Morlock:

"GemIni has been used to teach language to students in our school. To give background, most of the students we work with at Eden have severe cognitive impairments to accompany their behavioral challenges; it can take six months for a student to master a new skill. We have found that the GemIni videos work really well for approximately 2/3 of the students, and students who are using GemIni have mastered words after three-seven video modeling sessions. Each session includes viewing videos 10 times. **This is a substantial acceleration in language acquisition rates for these children.**"
